

### Fatigue - Staying Alert

Fatigue is more than feeling tired; it's a state of mental and/or physical exhaustion that reduces a person's ability to perform work safely and effectively. Fatigue can slow reaction times, lower attention levels, and impair judgment, leading to a higher risk of incidents.

# What's the Danger?

Fatigued workers are more likely to make mistakes that could result in injury to themselves or others. Fatigue can also cause microsleeps — brief, involuntary episodes of sleep, while operating equipment, driving, or performing critical tasks.

	Hazard	Description
×	Operating Machinery While Tired	Slow reactions, equipment mistakes, and poor hand-eye coordination.
<b>4</b>	Driving Vehicles When Drowsy	Risk of accidents, microsleeps, impaired speed/distance judgment.
<u></u>	Making Critical Decisions With Impaired Judgment	Poor problem-solving, risky decisions, missed safety checks or steps.
Q	Performing Detailed or Hazardous Work Without Full Focus	Skipped or forgot steps, mishandled tools, materials, or chemicals, and higher injury risk.
J	Night Shifts, Extended Hours, or Irregular Schedules	Sleep cycle disruption, chronic exhaustion buildup.

Recognizing signs of fatigue early helps prevent mistakes, injuries, and incidents.

Physical	Mental
<ul> <li>Frequent yawning</li> <li>Heavy eyelids</li> <li>Slower movements</li> <li>Difficulty staying upright or balances</li> </ul>	<ul> <li>Poor concentration</li> <li>Forgetfulness</li> <li>Slower decision-making</li> <li>Zoning out (blank stares)</li> </ul>
Emotional FATI	Behavioral
<ul> <li>Irritability</li> <li>Low motivation</li> <li>Mood swings</li> <li>Frustration or impatience</li> </ul>	<ul> <li>Increased mistakes</li> <li>Poor communication</li> <li>Risk-taking behavior</li> <li>Ignoring safety procedures</li> </ul>

When workers notice fatigue symptoms like poor concentration or slower reactions, they can take action such as resting, notifying a supervisor, or adjusting tasks **before** it leads to a serious incident.

## Safety Tips

- ✓ Get 7-9 hours of sleep per night whenever possible.
- ✓ Take scheduled breaks and use them to rest and recharge.
- ✓ Avoid excessive overtime or long shifts whenever feasible.
- ✓ Recognize signs of fatigue
- Stay hydrated, eat nutritious foods, and limit caffeine late in the shift.
- ✓ Report to your supervisor if you feel too fatigued to work safely.

# **DID YOU KNOW?**

Nearly 30% of Canadian workers report feeling fatigued most days or every day during a typical work week. Workers who sleep less than 5 hours a night are <u>three</u> times more likely to be injured on the job than those who sleep 7–8 hours.

#### Demonstrate

Show simple stretches or mindfulness exercises that can be done during short breaks to boost alertness.

Highlight scheduling controls like rotating shifts and scheduled rest breaks.

#### Discussion

What signs of fatigue have you personally noticed while working?

What steps do you take to stay alert during long or late shifts?
